

Sprint 1 - Business Strategy

Strategy-to-project chain

1. Business context

Campus parking is constrained and high-emotion. Hidden open bays cause wasted time and entrance congestion. Cameras exist; availability signals do not.

2. Strategic objective

Reduce time-to-park and lot-entrance congestion by publishing trustworthy, bay-level occupancy from existing camera infrastructure - starting with one pilot lot.

3. Why this software project

- Scarce asset is information, not more asphalt.
- Semester team can prove pilot management story before larger spend.
- PM discipline prevents scope from expanding into autonomous mobility.

4. How the project serves the objective

Define and manage an occupancy pipeline concept: frames -> bay states -> live counts/map for drivers and ops. Portal documents the chain from strategy to backlog.

5. Not optimizing for (yet)

- Payment, permitting, citations
- City-wide SaaS expansion
- Marketing perfect accuracy on day one - measure and disclose failure modes

One-sentence strategy: Use software on cameras the campus already owns to make hidden open stalls visible - cutting circling before pouring more concrete.
